Claims 1 - 12 (Cancelled).

13. (New) A device, comprising:
a housing element with a first thread; and
a second element with a second thread, which is complementary to the first thread and is engaged therewith; said housing element and said second element are twistable relative to one another about the axis of the two threads, the twisting causes a change of the axial position of one with respect to the other due to the pitch of the threads, wherein:

a twist limiting feature, limits the twistability of said housing element relative to said second element to an angular range, and

said twist limiting feature comprises two axial barriers, so that the axial position of said housing element relative to said second element is limited to a range between two extreme positions determined by said axial barriers.

14. (New) The device as claimed in claim 13, wherein:
said axial barriers are so arranged, that the difference between the extreme positions corresponds to the axial shift caused, for given thread pitch, by a twisting of said housing element relative to said second element by the maximum allowable angle of twist.

15. (New) The device as claimed in claim 13, wherein:
one of said housing element and, said second element includes at least two cylindrical sections of differing radii, whose axis of rotation is aligned with the axis of the threads, and

between the at least two sections of differing radii, a radial step is formed, which serves as an axial stop surface for an axial barrier of said twist limiting feature.

16. (New) The device as claimed in claim 15, wherein:
one of said housing element and said second element includes a cylindrical section, whose lateral surface includes an inwardly extending annularly running groove, and is bounded in the axial direction by first and second radial steps, and
said first and second radial steps each serve for one of said two axial barriers.

17. (New) The device as claimed in claim 13, wherein:
one of said housing element and said second element includes at least one duct with cylindrical sections of differing radii, whose axis of rotation is aligned with the axis of the threads, and
between the at least two sections of differing radii, a radial step is formed, which serves as an axial stop surface for an axial barrier of said twist limiting feature.

18. (New) The device as claimed in claim 16, wherein:
one of said housing element and said second element includes a cylindrical duct, whose lateral surface exhibits an annularly running groove, which extends radially outwards and is bounded in the axial direction by a first and a second radial step, and
said first and second radial steps each serve as an axial stop surface for one of said two axial barriers.

19. (New) The device as claimed in claim 18, wherein:
said twist limiting feature further comprises a coupling element, which is engaged both with said radially outwardly extending groove and with said radially inwardly extending groove.

20. (New) The device as claimed in claim 19, wherein:
said coupling element comprises an annular washer.

21. (New) The device as claimed in claim 20, wherein:
said annular washer is radially flexible.

22. (New) The device as claimed in claim 19, wherein:
said radially inwardly extending groove has a first breadth in the axial direction,
and said radially outwardly extending groove has a second breadth in the axial
direction, and
the axial thickness of said coupling element is selected such that the sum of the
first breadth and the second breadth, minus twice the axial thickness, corresponds to
the axial shift caused at the given pitch of the threads by a twisting of said housing
element relative to said second element by the maximum allowable twist angle.

23. (New) The device as claimed in claim 13, wherein:
said second element comprises a sensor element.

24. (New) The device as claimed in claim 13, wherein:
said housing element includes a measurement transmitter housing, and the
sensor element an industrial process measurement sensor, especially a pressure
sensor, flow rate sensor, viscosity sensor, fill level sensor, pH-sensor or other
potentiometric sensor, temperature sensor, moisture or humidity sensor, gas sensor or
turbidity sensor.
